$l(l+1) \rightarrow m^2 - 1/4$, which is to say, $l^2 + l + 1/4 = m^2$, or $(l + 1/2)^2 = m^2$, or $l = |m| - 1/2$. [Our present equation depends only on m^2 , and hence is the same for either sign, but the solution to Problem 4.39 assumed $l + 1/2 \geq 0$ (else u is not normalizable), so we need $|m|$

All of these books titled "Problems and Solutions on (subject): Major American Universities Ph.D. Qualifying Questions and Solutions" are invaluable tools for a physics graduate student, in my experience. For quantum mechanics in particular, solved problems often illustrate difficult concepts better than any explanatory paragraph in a text.

Max Planck corrected this model using Boltzmann's statistical interpretation of thermodynamics and proposed what is now called Planck's law, which led to the development of quantum mechanics. After Planck's solution in 1900 to the black-body radiation problem (reported 1859), Albert Einstein offered a quantum-based explanation of the photoelectric effect (1905, reported 1887).

Course 2 of Statistical Thermodynamics presents an introduction to quantum mechanics at a level appropriate for those with mechanical or aerospace engineering backgrounds. Using a postulatory approach that describes the steps to follow, the Schrodinger wave equation is derived and simple solutions obtained that illustrate atomic and molecular structural behavior.
